

## Motor unit AP

- Triphasic form

- 3~15 ms

- 20~2000  $\mu\text{V}$

## Surface vs Needle electrode

S: Cross-talk from adj muscles

$\Rightarrow$  Poor selectivity

N: Small pickup area  $\Rightarrow$  Individual MU

## Neuropathy:

- Difficulty in initiating nerve impulse

- Takes long time to transmit to muscle

$\Rightarrow$  EMG scatter & desynchronisation

## Test EMG:

① At needle insertion

② At rest

③ Min contraction

④ Max contraction

## TRANSDUCER

Case: Prevent electric shock

Damping material: Reduce vibration

Improve axial resolution

Piezoelectric crystal: Piezoelectric effect

Matching layer: Acoustic impedance between crystal & skin

Transmit more ultrasound into tissue

## ATTENUATION

### ① ABSORPTION (friction)

- High viscosity
- Long relaxation time
- High frequency

$$\frac{\sin \theta_1}{\sin \theta_2} = \frac{V_1}{V_2}$$

### ② REFRACTION

### ③ SCATTERING

### ④ DIFFRACTION

### ⑤ INTERFERENCE

### ⑥ REFLECTION

$$V_{\text{air}} = 330 \text{ m/s}$$

$$V_{\text{water}} = 1400 \text{ m/s}$$

$$V_{\text{soft tissue}} = 1540 \text{ m/s}$$

$$V_{\text{bone}} = 3400 \text{ m/s}$$

## Continuous:

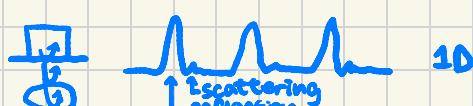

- Doppler flow measurement

- Therapy

## Pulse echo:

- Imaging

## AMPLITUDE MODE (A-MODE)

## BRIGHTNESS MODE (B-MODE)

2D image of bright dots

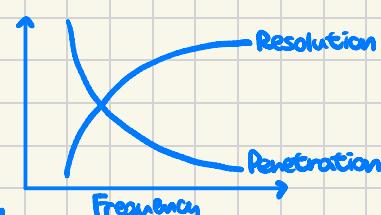

## MOTION MODE (M-MODE)

Detailed visualisation of long axis

## DOPPLER

$$f_d = f_r - f_t$$

$$f' = \frac{V + V_s}{V - V_s} f \cos \theta$$

### Axial resolution:

- Spatial pulse length
- Ultrasound frequency

### Lateral resolution: (limiting factor)

- Transducer Size
- Beam width

$\therefore V_{\text{bone}} \gg V_{\text{soft tissue}}$

$\therefore$  Image of bone is axially compressed

$\Rightarrow$  Bone distortion

## Lab-on-a-chip (MEMS/Microfluidics)

- Fluorescence-based DNA Biosensor

- Label-free sensors

- Field effect (charge  $\rightarrow$  current)  $\rightarrow$  Protein

- Electrochemical (chemical  $\rightarrow$  current)  $\rightarrow$  Glucose

- Cantilever (mass  $\rightarrow$  frequency)  $\rightarrow$  Protein

## BINDING AFFINITY

$$\frac{d[A][B]}{dt} = k_a [A][B] - k_d [AB]$$

$$k_a [A][B] = k_d [AB]$$

$$K_d = \frac{k_d}{k_a} = \frac{[A][B]}{[AB]} \quad (50\% \text{ bound})$$

OA

YB

AB  
Transducer

$k_a$ : association rate const

$k_d$ : dissociation rate const

## ELECTROCHEMICAL SENSOR

Enzyme  $\rightarrow$  Redox  $\rightarrow$  Current

Concentration  $\propto$  Rate of reaction  $\propto$  Current

- Accurate & Reliable ( $\sim$  ppm)

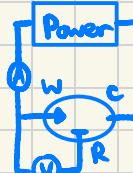

- Power-efficient

- Portable & Easily integrated

- Limited lifespan (2-3 yrs)

- Require calibration against reference

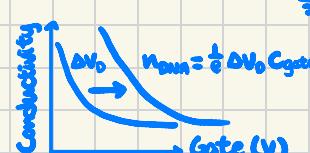

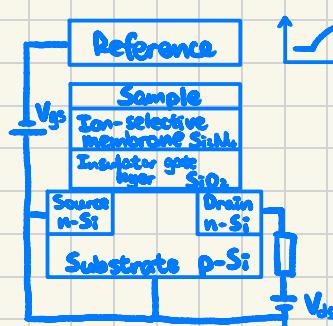

- Sensitive to temperature

Ag/AgCl:  
Working electrode  
Counter electrode  
Reference electrode

## FIELD EFFECT SENSOR

Charge  $\rightarrow$  MOSFET  $\rightarrow$  Conductivity

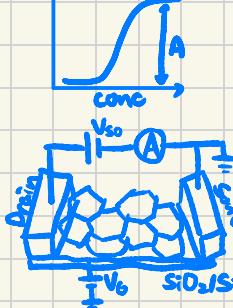

$$\Delta V_D^{\text{rel}} = \frac{1}{2} \Delta V_D C_{\text{gate}}$$

## GRAPHENE FIELD EFFECT DNA SENSOR

$$\Delta V_D^{\text{rel}} = \frac{C}{K_D C_D}$$
